

1.

```
<form method="POST" action="madeuplink">
  <textarea name="funfact" rows="10" cols="100" placeholder="Tell me a fun fact about yourself!"></textarea>
  <br><input type="submit" value="Send Fun Fact">
</form>
```

Tell me a fun fact about yourself!

Send Fun Fact

While the current code works completely fine at displaying the textarea it breaks when you press submit since I did not use an actual link in the action attribute, so I figure I'll just remove it since this assignment doesn't require that we show we know how to use a form. I'm going to use JavaScript to make the button show a different message once you have clicked "Send Fun Fact" so the user knows it sent successfully (even though technically it does nothing)

```
//Fun fact button
document.getElementById("sendFun").onclick = function () {document.getElementById("sendFun").setAttribute("value", "Fun Fact Sent!")};
```

I like trains

Fun Fact Sent!

Now the button says "Fun Fact Sent!" when the button is pressed.

2.

```
<div class="footer">
  <h2>
    |   Contact Me: <a href="mailto:AlexM@dal.ca">Email</a>
  </h2>
  <h2>
    |   © Alex MacLean 2023-2023
  </h2>
  <h2>
    |   Offices at: Hammonds Plains, Nova Scotia, Canada
  </h2>
</div>
```

Contact Me: [Email](mailto:AlexM@dal.ca)

Offices at: Hammonds Plains, Nova
Scotia, Canada

Since I now have access to making notifications, I will draw extra attention to the footer when people view my about me so they are reminded that they can contact since they might be inclined to do so after reading the page.

```
//Contact info alert
if (document.querySelector('ul li ul li:first-child') != null){
  if (document.querySelector('ul li ul li:first-child').textContent == "My Professor was Dr. Siegel"){
    window.confirm("Be sure to check out my contact info at the bottom of the page!");
  }
}
```

This page says

Be sure to check out my contact info at the bottom of the page!

OK
